

Measuring Habitat Characteristics in Golden-winged Warbler Territories:

What's important and how do we quantify it?

Range-wide Golden-winged Warbler Conservation Initiative

- Goals/objective statement from NFWF proposal

“The overall goal of this project is to document Golden-winged Warbler population sources/sinks and to associate demographics with habitat characteristics”

- In essence, what we are attempting to do is use golden-winged warbler demographics to identify high quality habitat.

Demographics Aspects

- Territory Density
- Nesting success
- Genetics

- Missing an opportunity to relate these hard-earned demographic data with meaningful habitat characteristics.
- Ultimately, lowering our chances of synthesizing these relationships into meaningful habitat prescriptions.

- utilizes a variety of plant community types
- habitats are extremely patchy

Quantifying Habitat Characteristics is Difficult

It takes a lot of thought:

Like many studies of wildlife/habitat relations we are presented with the challenge of:

- Identifying habitat features that are characteristic of high quality habitat.
- Measuring these features while walking the fine line between effectively sampling a site (data quality) and sampling enough sites (data quantity: sample size)

Golden-winged Warbler Conservation Initiative: Pennsylvania

Golden-winged Warbler
Vermivora chrysoptera

Pennsylvania
(GWWA -7.2%/yr 1966-2005)

Pennsylvania Study Sites

Bald Eagle State Park

(GWWA, BWWA, Hybrids)

- Ridge and Valley Physiographic Province
- 210-245 m (700-800 ft)
- a mosaic of fragmented forests, scrub-shrubland, managed grasslands, and powerline rights-of-ways
- agricultural and residential land uses dominate the surrounding landscape.

Sproul State Forest

(GWWA only)

- 112,000 ha public forest land
- Mountainous High Allegheny Plateau
- 610m (2000 ft)
- dominated by mature forests and the surrounding landscape is predominately 80-100 years-old northern hardwood or dry oak forest.
- GWWA are restricted to regenerating clearcuts, gas well sites, and portions of a 4000 ha area that burned in the early 1990s.

Bald Eagle State Park

- Not only do these two study areas occur in very different landscape contexts, plant communities occupied by GWWA also differ considerably

Bald Eagle State Park

Drier sites: autumn-olive, multi-flora rose, and honeysuckle

Sproul State Forest

Sapling/shrubs: Red maple and sassafras

Sproul State Forest
Black locust snags and Rubus spp.

Sproul State Forest

Blueberry-huckleberry, sweet-fern, and mountain laurel dominate ground layer with scattered areas of forbs & grasses

Sproul State Forest
Rubus spp. / forbs/ grass ground layer

Territory mapping-SSF

(1 May – late June 2008)

Territory mapping-BESP

(1 May – late June 2008)

Habitat Sampling (late-June - mid-July)

Habitat features

- 1m radius circle
- percent cover
 - Grasses
 - Forbs
 - Ferns
 - Blackberry
 - Huckleberry/blueberry
 - Sweet-fern
 - Mountain laurel
 - Shrubs < 2m
 - Shrubs > 2m
 - Saplings (<10cm dbh)
 - Tree canopy (>10cm dbh)
- distance to micro-edge.
- At every 5th sampling point
 - number of "in" trees using a 2.5m²/ha prism
 - number of snags within 11.3 meters
 - distance to closest shrub (<2m tall)
 - distance to closest shrub (>2m tall).

0=0%, 1=1-3%, 2=4-15%, 3=16-33%, 4=34-65%, 5=66-100%

Analyses

- Logistic Regression
 - Used vs. Available
- Principle Component Analysis
 - within GWWA territories at BESP (n=27)
 - within GWWA territories at SSF (n=29)
 - within GWWA territories Combined (n=56)

Habitat Measures with the Least Variation (Based on PCA)

<u>BALD EAGLE (n=27)</u>	<u>SPROUL (n=29)</u>	<u>COMBINED (n=56)</u>
Shrub <2m cover	Shrub <2m cover	Forb cover
Dist. micro-edge	Dist. shrub >2m	Blackberry cover
Tree count	Blackberry cover	Dist. shrub <2m
Tree cover	Snag count	Dist. shrub >2m
Sapling cover	Dist. shrub <2m	Shrub <2m cover
Dist. shrub < 2m	Sapling cover	Fern cover

- These are the variables that contributed most to the components that varied least within GWWA territories
- Bolded variables were those that did not also vary least outside of GWWA territories

Logistic Regression Used vs Available Territories

- GFFS1- Composite variable contrasting the amounts of Grass (-), and Forbs (-) with Ferns (+) and Saplings (+)
- Shrubs 1- Composite variable contrasting shrub counts (-) and shrub distance from transects (+)
- Shrub 2- Composite variable contrasting counts of shrubs with heights less than 2m (+) with counts of shrubs with heights greater than 2m (-)

Logistic Regression Used vs Available Territories

- Compared to available “territories”, GWWA territories had:
 - more grasses and forbs and less ferns and saplings
 - more shrubs and those shrubs were closer to the transect
 - More shrubs <2m tall and less shrubs >2m tall
 - More blackberry

Logistic Regression Goodness of Fit (Area Under the ROC Curve)

Apparently important habitat features in PA

PCA

Distance to micro-edge (BESP)
Sapling cover (BESP)
Snag count (SSF)
Distance Shrub >2m (SSF)
Blackberry cover (SSF)
Distance Shrub >2m (combined)
Blackberry cover (combined)

Logistic regression

Grasses and forbs (more)
Ferns and saplings (less)
Shrub cover <2m tall
(more)
Shrub cover >2m tall
(less)
Blackberry (more)

Consistent for both analyses

Distance Shrub >2m
Blackberry cover
Saplings
Forb

Going forward, What other variables should we quantify?

- Develop a metric that quantifies “patchiness”
- Include metric that quantifies forest edge

- Hire at least one technician with strong botanical background

GOLDEN-WINGED WARBLER
CONSERVATION INITIATIVE

BREEDING HABITAT GUIDELINES

for the Eastern U.S. & Canada

*A Publication of the
Golden-winged Warbler Working Group*

Critical that breeding ground habitat researchers get together soon to discuss the development of a range-wide standard habitat sampling protocol.

Only after the development of such a protocol will we be able to properly compare and contrast GWWA habitat requirements range-wide

Golden-winged Warbler community type preferences vary geographically, and therefore some conservation strategies are region specific. Many recommendations are generic and based on expert opinion until more detailed information becomes available.
